

FORTNIGHTLY e-BULLETIN: ANIMAL DISEASE INFORMATION OF BHUTAN*Information sharing for preparedness and response...*

National Centre for Animal Health
Department of Livestock
Ministry of Agriculture and Forests
Serbithang, Thimphu

To update field colleagues and relevant stakeholders regarding animal disease situations in the country and related activities, the "Fortnightly e-Bulletin on Animal Disease Information of Bhutan" is issued by the Disease Prevention and Control Unit (DPCU), National Centre for Animal Health (NCAH), Department of Livestock (DoL). The information disseminated regarding animal disease outbreak(s) in the country is based on flash and follow-up reports received from the outbreak investigation team. For real-time update, please visit our website, <http://www.ncah.gov.bt>

Chhukha Dzongkhag**Phuentshogling Gewog****Rabies: 31 July 2021***

A case of rabies in cattle was reported from Kabraytar area, Phuentshogling Thromde, Chhukha dzongkhag on 30 July 2021. As per the flash report shared, a young male stray cattle was affected and succumbed to the infection, which was confirmed to be rabies through a rapid Ag test.

In line with the National Rabies Prevention and Control Plan 2017, all the necessary prevention and control measures have been implemented by the Thromde Veterinary Hospital and Satellite Laboratory (TVH&SL), Phuentshogling.

ALERT!**Early warning and preparedness to prevent LSD outbreaks**

Considering the epidemiology of the disease, the risk for incursion and spread of Lumpy skin disease in Bhutan at this time period is very high, especially in the areas stretching across the southern belt (Samtse in the west to Trashigang in the East), sharing a porous border with India, and experiencing hot and humid climate and increased fly (mechanical vector for LSD) activity.

LSD prevention and control measures shall be implemented as described in the advisory table given below.

Measures	Remarks

Uninfected Dzongkhag/ premises	
Farm biosecurity enhancement	In collaboration with the BAFRA office.
Vector control	Use of insect repellents and ectoparasiticides, improve farm sanitation and hygiene, good manure management, etc.
Restriction on cattle (migratory or trade) and their products' movement from infected areas.	Practice until the ban is lifted in the affected and surrounding areas.
Enhance disease surveillance	To ensure early detection and prevent further spread. Surveillance is to be heightened during summer (fly season) and when outbreaks are reported from nearby areas.
Wearing minimal PPE when visiting farms	At least a shoe cover to prevent mechanical transmission.
Infected Dzongkhag/ premises or suspicion of disease presence	
Restriction of movement of cattle and buffaloes in infected areas	Until the outbreak ends, and bans lifted.
Restriction of movement of cattle and buffalo products from infected to uninfected areas.	Until the outbreak ends, and bans lifted.
Isolation and treatment of affected animals.	Supportive or symptomatic treatment
Proper disposal (deep burial) of carcasses and disinfection of contaminated premises.	Consumption shall not be permitted. Phenol and Hypochlorite (bleaching powder) are effective against LSDV
Active surveillance	Risk-based surveillance for early detection, immediate interventions and prevent further spread.
Vector control	Use of insect repellents and ectoparasiticides, improve farm sanitation and hygiene, good manure management, etc.
Farm biosecurity enhancement	In collaboration with the BAFRA office.
Using PPE while visiting affected (suspected) farms	Plastic apron, gloves, shoe covers, etc.
Prevention of iatrogenic spread of infection	Mandatory change of needle between animals during vaccinations/ treatments, or sterilize the reusable needles.
